```

assets

- `build` contains minified and optimised core `.css` and `.js` files
- `config` contains general JavaScript config file
- `css` contains compiled `react.css` and `linea.css`
- `font` contains the font files
- `images` contains the page's images, divided by category. Put all of your images in this directory, as that's where they get optimised via [Gulp tasks](#)
- `js` contains the core JavaScript file as well as a `skins` directory, containing skin specific JavaScript files

favicons

This directory contains favicons. And a file called `manifest.json`, which you should edit by placing your company's name in it.

gulp

You can find gulp commands here, they are being injected into gulpfile.js in the project's root.

libs

The place for the libraries used in this template.

mailer

PHP files that are needed to make the contact form function are located here. In `templates` directory you'll be able to find the predesigned mail templates.

src

jade

- `./` (i.e. the directory itself) is the home directory of all your `.jade` files, particularly `index.jade`
- `layout` contains header and footer layouts
- `posts` is a directory for the blog posts

- `projects` is where all your projects and their modals are located
- `sections` contains all the sections, which are later included into `base.jade`

`sass`

- `./` contains the main `moderat.scss` file as well as all of its components
- `components` contains styles of the theme's components
